

Modify the following existing Standards to include the recalled capacity language:

Modify 5.3.36

TSP should support the concurrent sending of electronic notification of recalled capacity, intraday bumps, operational flow orders and other notices to two Internet E-Mail addresses for each affected party.

Modify 1.3.51

Recalled capacity notices and Intraday bump notices should indicate whether penalties will apply for the gas day for which quantities are reduced.

Modify 1.3.52

On the Scheduled Quantity Web page, a mechanism should exist to display those line items that result in nomination reductions due to recalled capacity first, followed by intraday bumping before all other line items or allow the selection of only those line items that have been reduced due to capacity recalled or intraday bumps.

Modify 5.3.34

TSPs should provide affected parties with notification of recalled capacity, intraday bumps, operational flow orders and other critical notices through the affected party's choice of Electronic Notice Delivery mechanism(s)

Modify 5.3.39

TSPs may offer other notification mechanisms in addition to those referenced in GISB Standard 5.3.34 (e.g., EBB/EDM, FF/EDM). The TSPs should include at least the same level of information for notification of recalled capacity, intraday bump, operational flow order or other critical notice regardless of the method of notification.

Proposed Standards:

5.3. z10

Recalls of released capacity will not be permitted to reduce (bump) already scheduled volumes for replacement shippers unless the replacement shippers are provided with at least one opportunity in each nomination cycle to reschedule any bumped volumes within the same gas day.

5.3.z11

Replacement shippers must be given advance notification of any recall and cannot have scheduled volumes reduced unless they have been given an opportunity to reschedule their gas within the same gas day.

Proposed 5.3.z8 Version 2 or 5.3.z12

Releasing shipper may to extent permitted as a condition of capacity release, recall scheduled released capacity so long as the replacement shipper(s) can obtain capacity to replace recalled capacity at same cycle for the same gas day. Unscheduled capacity may be recalled at any cycle as long as the TSP and Replacement Shippers are notified 2 hours prior to nomination deadline.
